NEW HT7 METAL BACKED SANDING PAD

Hiretech announce a new metal backed sanding pad for the HT7 Disc Floor Sander for improved 'feel and touch' and increased sanding performance.

FEATURES

Metal backed edger sanding pads, traditionally used in the professional floor sander market, are tough and resilient but lack feel and are unforgiving when used by an inexperienced operator.

Hiretech have designed and developed a new, metal backed sanding pad that provides the performance of a traditional pad with the feel and touch of Hiretech's nylon backed pad.

A high precision press tool produces a dynamically balanced disc to which the rubber sanding pad is bonded using a specially developed process.

This special process allows the rubber pad to be bonded to the metal back leaving an 8mm (5/16") deep rubber edge around the whole circumference of the disc. This provides far better 'feel and touch' to the sander than a traditional metal backed pad, where the metal back covers the whole of the rubber pad down to its front edge. This design also allows the pad to be accurately trimmed and properly maintained through the whole of its life.

The design also improves operator safety and reduces the risk of base boards, pipe work and other exposed work surfaces being cut into, as there is no exposed metal edge to the pad as found on a traditional or poor quality metal backed sanding pad.

The Hiretech metal backed sanding pad is manufactured as a dynamically balanced component that does not require any additional balancing or corrective procedures to make it run without vibration. This ensures that the sander will run smoothly prolonging both the life of the pad, drive gear and motor line of the sander.

The dynamic balance and increased weight of the metal backed pad produces a 'flywheel' effect, balancing centrifugal forces of the motor and making the HT7 even easier to handle and use.

Colour of sanding pad for illustration purposes only, production unit colour will vary.

USES

The Hiretech metal backed and nylon backed sanding pads are suitable for use on all HT7-2, HT7-1 and Super Seven Disc Floor Sanders and Edgers and all floor types.

The metal backed pad is fitted as standard to all new¹ HT7-2 Disc Floor Sanders and is recommended for professional and quality hire and rental applications.

The nylon backed pad is recommended for use where the machine is likely to be operated only by homeowners or where there is limited access to service and support.

SPECIFICATIONS

Part Code : 012310
Description : Sanding Pad (metal backed)
Type : Metal backed bonded rubber
Weight : 0.7kg (1.5lbs)

Part Code : 010650
Description : Sanding Pad (nylon backed)
Type : Nylon backed rubber bonded
Weight : 0.4kg (0.9lbs)

¹Part Code 012310 fitted as standard to all new HT7-2 Disc Floor Sanders from Serial Number 03958 (110 Volt) and Serial Number 11010 (240 volt).
